

README – Medium-Fidelity Prototype

1. App Overview

Introducing a health companion app designed to help users understand wearable device data through clear visualizations, personalized insights, and supportive feedback. While many people own smartwatches and fitness trackers, they often find it challenging to interpret the information these devices gather. Watcher fills this gap with its user-friendly interface, mood and activity tracking features, and AI-generated health advice, making it easier for users to enhance their well-being.

Key Features:

Personalized AI Health Assistant: Offers intelligent suggestions based on heart rate, HRV, stress levels, and mood input.

Health Data Summary & Visualization: Shows a simplified overview of the user's heart data and trends.

Onboarding & Customization: Users input age, weight, goals, and conditions to tailor their experience.

Mood & Activity Tracking: Let users reflect on how they feel and what they've been doing.

2. How to Use the Prototype

The prototype includes three major user flows, each illustrating a key part of the Watcher experience:

Flow 1 – Sign Up and Personal Health Info Setup

1. Welcome Screen
Tap Sign Up to start using the app.
2. Sign Up Form
Enter your name, email, and password.
3. Information Step 1
Fill in basic details: Name, Gender, Age, Height.
4. Information Step 2
Add: Weight, Blood Type, Current Conditions, Activity Level, Location, and Goals.
5. Home Page
Once done, you're redirected to the personalized dashboard.

Flow 2 – Heart Health Review and Input

1. Tap the “Heart Rate” section on the home screen.
2. View metrics like:
 - Pulse
 - Heart Score
 - HRV
 - Stress and Energy Levels (with visual bars)
3. Log how you're feeling (emoji-based mood selector).
4. Select recent activities (e.g., resting, after sleep).
5. Save your inputs to complete the session.

Flow 3 – Receive AI Feedback

1. After saving, navigate to the “AI Assistant” screen.
2. The AI reviews your heart data + personal input.
3. It generates custom messages like:
 - Possible health interpretations
 - Encouraging messages
 - Reminders to rest or seek support

3. Tools Used & Known Limitations

Tools:

- Figma - Design and prototype
- Google Sites – Project website
- Google Docs – Testing and notes
- Zoom/In-person – User testing sessions

Limitations:

- This prototype is of medium fidelity, simulating backend and real-time AI functionality. Responses from the AI are all pre-defined, as live model integration is not yet implemented.
- Navigation focuses on essential task flows and does not encompass every potential screen edge case.
